

BIOGRAPHY

My journey in software development began at 11, when I learned the basics of Pascal. Over time I picked up PHP, HTML, CSS and JavaScript, and I became a full-stack developer at 15. After that I jumped into the world of Node.js, Angular, Vue and React. My sweet spot is, and always has been, the front-end and making things user-friendly, but I also enjoy writing back-end code and some queries from time to time.

Running my own businesses taught me a lot about building a great product and keeping customers happy with good customer service. I have had the pleasure of leading small technical teams in my previous projects, where we built things like 3D configurators, delivery tracking systems, custom CMS/CRM systems, 360° showrooms and many more...

I enjoy sharing my passion and experience as a speaker at conferences and meetups, and I like to give back to the community. I also enjoy combining technical skills with user needs and good UX. Whether it is back-end code or a smooth front-end, I aim for a balanced approach. I am excited to bring my mix of creativity, leadership, experience and commitment to your team.

PROFESSIONAL SKILLS

Development

What I work with
TypeScript, JavaScript, Node.js, React, React Native, Nest.js, Express.js, Docker, Rollup, Tailwind, Nativewind, CSS & pre-processors, Unit Tests, E2E Tests

What I know well
Golang, Angular, Vue.js, Webpack, PHP, Symfony

What I'm trying out right now
Zig, Swift, Odin

What I know a little
C, C++, Python, Java

...though I will always accept a new challenge!

Others

Responsive Design	UI/UX Design
UX Design & Consulting	Open-Source Software
Performance Optimization	Cloud Services
Docker & Docker stack	Data Optimization
3D Web & WebVR	Documentation writing

EXPERIENCE

From April 2025 to Present

ENGINEERING LEAD

Aristone s.r.o.

From April 2024 to April 2025

SENIOR SOFTWARE ENGINEER

IP Fabric s.r.o.

From September 2021 to April 2024

SENIOR SOFTWARE ENGINEER

Betsys s.r.o.

From September 2020 to July 2021

SENIOR FULL-STACK DEVELOPER

Summit Media Limited / Drivvn Ltd (UK)

From July 2019 to July 2021

CO-FOUNDER

Liekobox s.r.o.

From March 2018 to Present

FREELANCER

Dawid Grzegorz Zbiński - DEVELOG

From January 2017 to July 2019

WEB DEVELOPER

Ringier Axel Springer SK, a.s.

EDUCATION

From October 2016 to March 2017

Computer Science

Akademia Górniczo-Hutnicza im. Stanisława Staszica, Kraków, Poland

From September 2012 to May 2016

Information Technology

Súkromná Stredná Odborná Škola Tatranská Akadémia, Poprad, Slovakia

LANGUAGES, HOBBIES & INTERESTS

MORE ABOUT MY EXPERIENCE

IP Fabric s.r.o.

- Back-end: Node.js, Express.js, DDD
- Front-end: React, Styled components

We were building a web-based network monitoring tool used by some of the biggest companies in the world. We kept improving the platform, adding new features and making it more stable and reliable. There was also a constant need to add support for the newest network devices and to solve hard mathematical problems.

One of the things I was directly responsible for was our **plugin system**. Some clients wanted to write their own plugins to add extra information to their application. The plugin system was a fully dockerized part of our platform, with full management of the plugins from our web interface and special care for security and disaster prevention through special permissions and limits.

Interesting challenges:

- hard mathematical problems for topology calculations
- Docker management from within the web-based application
- sandboxing of the plugins

Betsys s.r.o.

- Back-end: Hexagonal architecture, CQRS, DDD, Nest.js, Golang & PHP
- Front-end: Angular, NgRx, Ant Design, SCSS, moved to OSS

I was responsible for the front-end development of a new **back-office application** that our employees used for everything related to our betting software and customers. Later, our team took over the "trust journey" of our clients, where we worked on security and performance improvements in projects like a completely new **Login API** and the overall back-end communication and authorization. We also integrated new tools for electronic client verification (**eKYC**), migrated away from a couple of legacy codebases and created new **strict company-wide rules for the codebases**, like ESLint standards, unit testing, dockerization, CI/CD flows and many Node.js libraries, some of which were later open-sourced.

Interesting challenges:

- custom system for environment variables in front-end apps, which removed the need for a separate build per environment
- dockerization of most applications and unit/e2e testing across multiple projects to keep up with the QA demands
- migration of legacy codebases and setting company-wide coding standards, which was an interesting management challenge

drivvn Ltd

- Back-end: Symfony, Node.js, ...
- Front-end: React, SCSS, Styled components

I was one of the people responsible for creating and maintaining the core applications for automotive projects running on the Drivvn software. Our biggest client, the PSA Group, was expanding its e-commerce services to multiple countries like Italy, France, Spain and the UK, which created big challenges for us, mainly in software architecture.

Front-end team:

- moved most of the repositories to React Hooks and Styled components
- divided the project into multiple smaller projects and configured the environment

Back-end team:

- implemented **multiple SAML services** (e.g. PinkFederate)
- built mainly in **Symfony (v4+)** with data stored in **ElasticSearch** and **MySQL**
- used multiple services for finance calculations and data synchronisation
- created internal hook-based communication between microservices

Run team (support):

- reduced the tech debt
- worked directly with client tickets (support tickets)
- created utility tools like pod-connector (a Node.js CLI application for interactive connection to Azure pods)

Ringier Axel Springer SK, a.s.

- Back-end: Symfony, Node.js, RabbitMQ, WebSockets (Socket.io), ...
- Front-end: Web Components, Vue.js, JavaScript ES5+, LESS/SASS, jQuery, ...

I was responsible for most of the Bistro.sk internal projects like Bistro Restaurant Administration, Bistro Driver and many others.

With me on site, we managed to refresh our codebase and split it into multiple parts, which **resulted in better performance, improved code quality and a faster, scalable and automatic deployment process**. Specifically, I created and managed the following projects (mostly) by myself:

REST API:

- created for Bistro and its subprojects to simplify the infrastructure and share centralized code across all the projects
- built mostly on the **PHP stack (Symfony 4.2, Doctrine ORM, Redis + Sentinel, SwiftMailer, Twig, etc.)**
- strictly **followed the REST specification** to keep the code maintainable
- optimized Symfony **for read-only environments** (which is pretty tricky)
- created **full CI/CD (GitLab) for testing, building and deploying the project**
- built from scratch on Alpine Linux with Docker and docker-compose, published in Docker Swarm as a stack of services

WebSocket Stack:

- created for services like Bistro Driver for efficient communication between multiple clients
- built on the **Node.js stack (Express, Socket.io, amqp)** with **RabbitMQ & nginx**
- **used the AMQP protocol** with the RabbitMQ client to queue all the messages, which made the project more scalable
- optimized for more than 1,000,000 requests per day from multiple sources at once

Bistro Restaurant Admin:

- created for the restaurants to give them the ability to analyze their sales and manage their presence on Bistro.sk
- built mostly on the **Vue.js stack (Vue.js, Vuex, Vue Router, Vue CLI)**
- development environment configured and set up using **Webpack & Babel**, so we could use some of the features from the new JavaScript versions/proposals which were not supported by the Vue CLI at the time (e.g. optional chaining)

Freelance Projects

- Back-end: Symfony, Node.js
- Front-end: Web Components, Vue.js, JavaScript ES5+, SASS, Angular, Three.js, Preact ...

With every offer I accept, I try to make the project somehow unique or different from the others, both technically and personally. For each project I always try to do my best and create a good product for a fair price. Also, each project has its own documentation and codebase (unfortunately, not many are public). Some of the recent projects I have worked on or still work on:

Liekobox.sk, Liekobox s.r.o. (liekobox.sk):

- created the front-end architecture for Liekobox, one of the biggest e-commerce services in Slovakia
- built in Angular, NgRx, SCSS and Angular Universal for the SSR
- implemented CI/CD for testing and deployment

Wardrobe Studio, Mr. Wood France (proprietary):

- 3D web studio which gives users the ability to create their own wardrobe with custom sizes, textures and placements
- **built from scratch using Three.js, Vue.js & Vuex**
- **optimized rendering of the textures** by optimizing WebGL loaders, texture sizes, formats and JavaScript garbage collection

3D Viewer, AR Visual s.r.o. (proprietary):

- 3D viewer for models in GLTF format in Three.js, which was later replaced by the model-viewer web component
- **custom logic implemented in Three.js underneath the model-viewer** (live texture replacements, etc.) and **Preact**

360° Picture Viewer, AR Visual s.r.o. (proprietary):

- custom image viewer which loads images taken from different angles and makes them interactive, similar to the 3D model
- built from scratch in **Vue.js + TypeScript + Three.js** and **exported as a Web Component**

360° Panorama Scenes, AR Visual s.r.o. (proprietary):

- HDRI image viewer connecting multiple scenes with interactive hotspots, music and a custom gallery
- built using **Marzipano** and **plain JavaScript**

Maffia party Game, Owner:

- multi-platform mobile native party game version of mafia/warewolf game that **communicates via WebRTC** with fallbacks
- created with **lowest possible resource use** in mind in Golang as API and React Native for Native and Web

and many other smaller websites and small projects ...

OPEN-SOURCE EXPERIENCE

I try to give back to the community from which I learned so much by contributing to open-source projects and by helping others on forums like stackoverflow.com.

axios-auth-refresh (npmjs.com/axios-auth-refresh - approx. **70K downloads a week**)

- simple library written in TypeScript for refreshing the authorization when using the Axios HTTP client

hourgit (hourgit.com)

- automatic development time-tracking cli tool

html-attribute-folder for IntelliJ-based IDEs (github.com/Flyrell/html-attribute-folder)

- free plugin for IntelliJ-based IDEs that adds attribute folding support (heavily awaited feature that JetBrains never finished)

shortr (github.com/Flyrell/shortr)

- free and open-sourced self-hosted URL shortener and QR generator with full dockerization

I was part of the core mentor team at **Azet Academy**, a program created by Ringier Axel Springer SK, a.s. to teach students to program in less than 3 months. **I was one of the people responsible for creating the curriculum for the academy**. The fields I focused on were **front-end technologies, software architecture, network communication and, last but not least, security**.
